

# Practical 3 - Advanced graphics

Osama Mahmoud

---

## Instructions

---

**Please note:** *The graphs shown at each question is only a suggested plot for the solution. You may want to reproduce it or create a different plot to answer the corresponding question.*

## Getting started

---

To get you familiar with the underlying `ggplot2` concepts, we'll recreate some standard graphics. Some of these plots aren't particularly useful, we are just using them for illustration purposes.

To begin with, load the `ggplot2`

```
library("ggplot2")
```

Next we load the `movies` data set

```
# Details of the movies dataset can be displayed by:  
library(ggplot2movies)  
data(movies, package="ggplot2movies")  
?movies
```

When loading in data, it's a good idea to check some basic characteristics:

```
str(movies)  
dim(movies)  
names(movies)  
head(movies)
```

## Plot some information

---

Feel free to experiment with your own ideas. I present some graphs as a reference that you may try to reproduce if you wish.

### 1. What is the number of movies produced per year?

---

**2. What is the number of movies produced per year per genre (action, animation ect)?**

```
# TIP: You need first to create a genre variable:
genre <- rep(0, nrow(movies))
for(i in 18:24)
{
  genre[movies[,i]==1] <- names(movies)[i]
}; genre[genre==0] <- "Unknown"
movies$Genre <- genre
```

**3. Create a graph to present information on the rating of movies.**

4. Is there a difference on rating depending on genre? (Hint: you may use `geom_violin`)

5. Is the rating influenced by the number of votes? (Hint: you may use `stat_binhex`)
